Science & Education Report

MS Roald Amundsen 04 - 21 April, 2025

Pacific Latin America:
Ancient Wonders and National
Parks

When you arrived on the MS Roald you boarded a research-focused expedition ship fully equipped as a floating laboratory and designed to be a center of learning and discovery. In your time on board, you contributed to scientific studies and expanded your knowledge of the world around you. Let's take a look back on our journey and what we accomplished while sailing north along the Pacific coast of Latin America.

Arts, crafts & creativity

We witnessed the amazing diversity of landscapes and cultures between Chile, Peru, Panama, and Costa Rica. We were inspired to create art reflecting our surroundings and our feelings. Through painting sessions, Andean pattern design sessions, and much more, we created tangible keepsakes of our journey.

Science & Education Program

The MS Roald Amundsen is more than a ship— it is a platform of opportunity for us to explore the world around us, collect meaningful data, and learn more deeply about the places we visit.

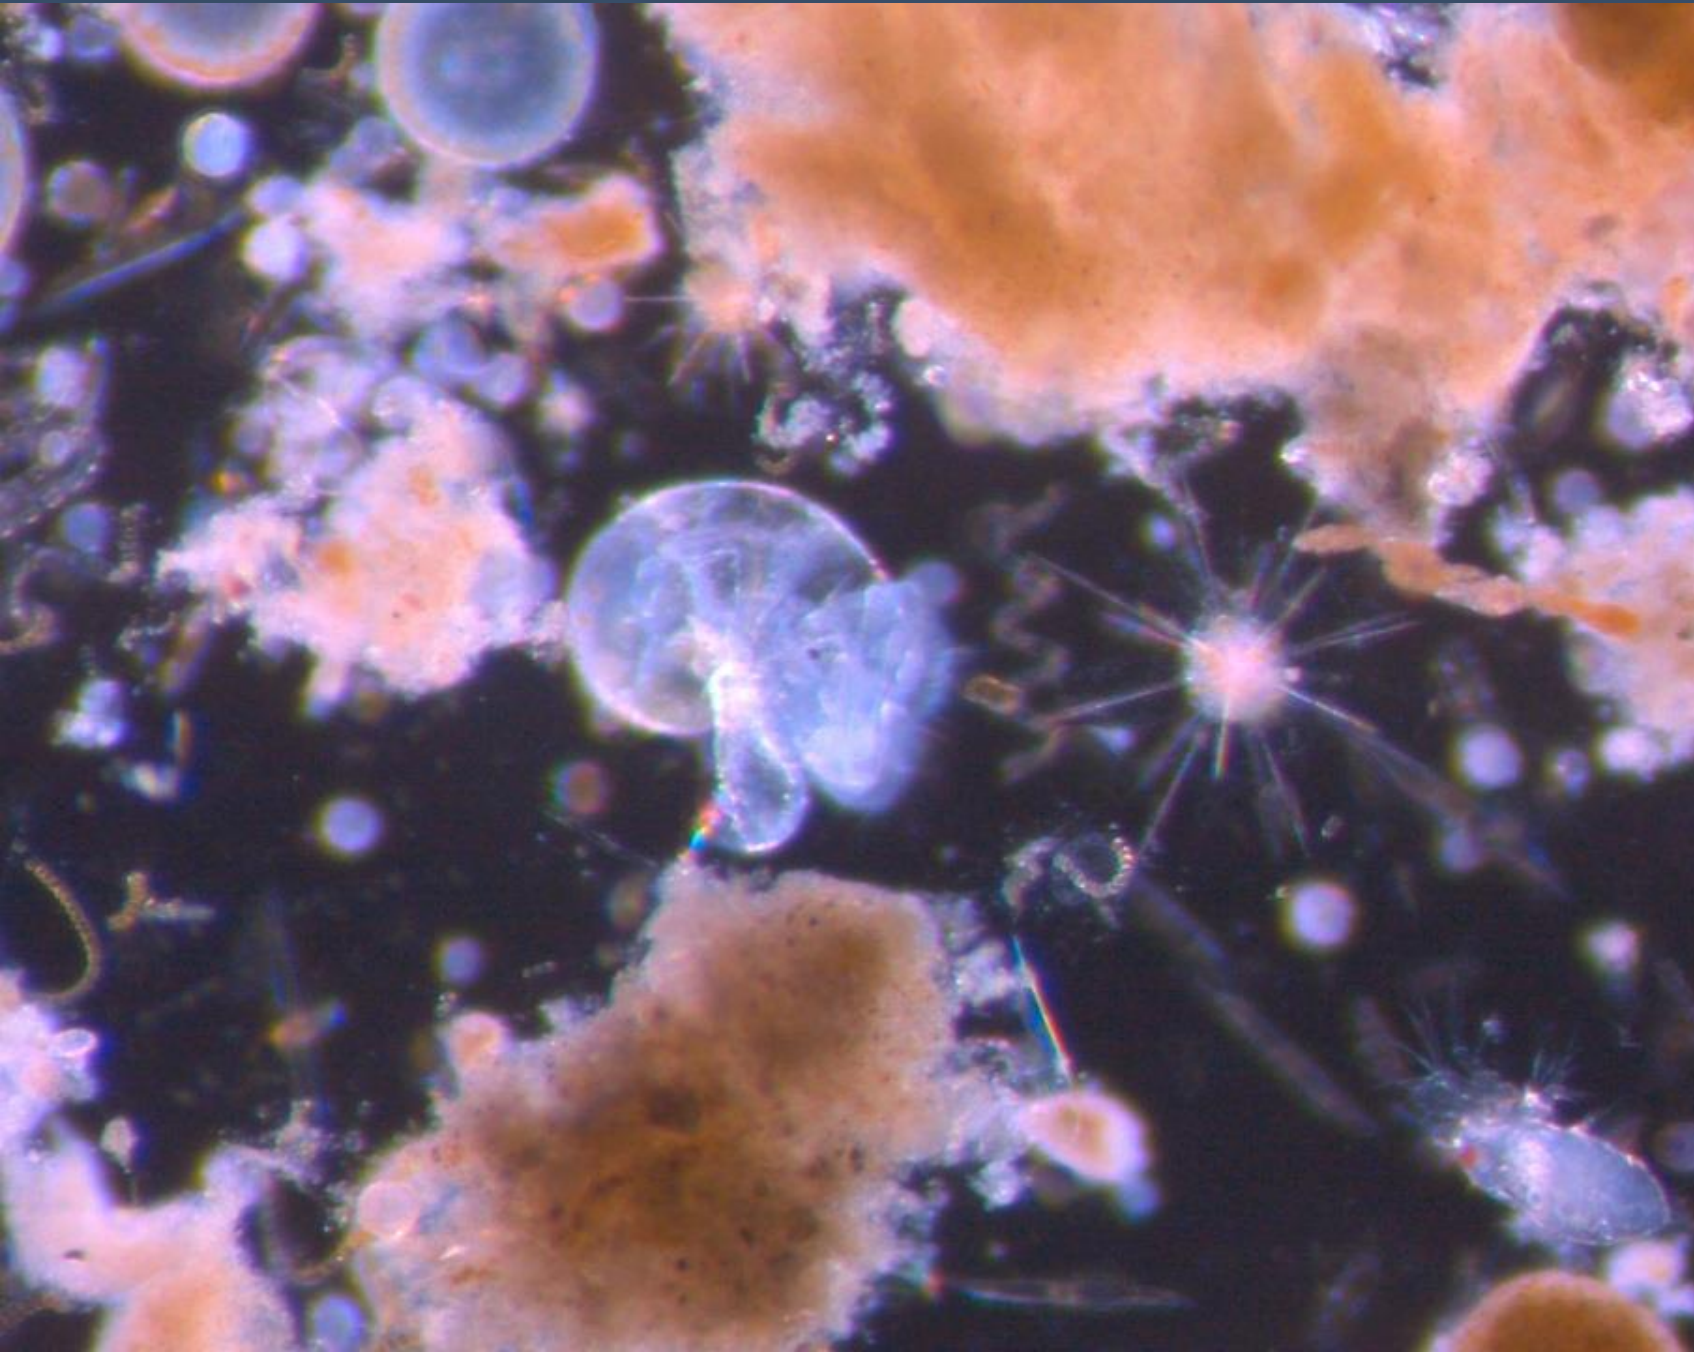

Our onboard naturalists guided our guests using scientific tools to investigate the world around us. We observed, documented, and discussed many interesting fauna, flora, and phenomena. From learning how volcanoes work to astronavigation, guests participated in sessions that gave a deeper understanding and appreciation for the natural world around us. Our historians put all of what we saw in the context of humans' relationships with this place— from the earliest inhabitants to modern society.

On the next pages you can find some highlights of our onboard Science Program as well as our Citizen Science Program.

History & Culture

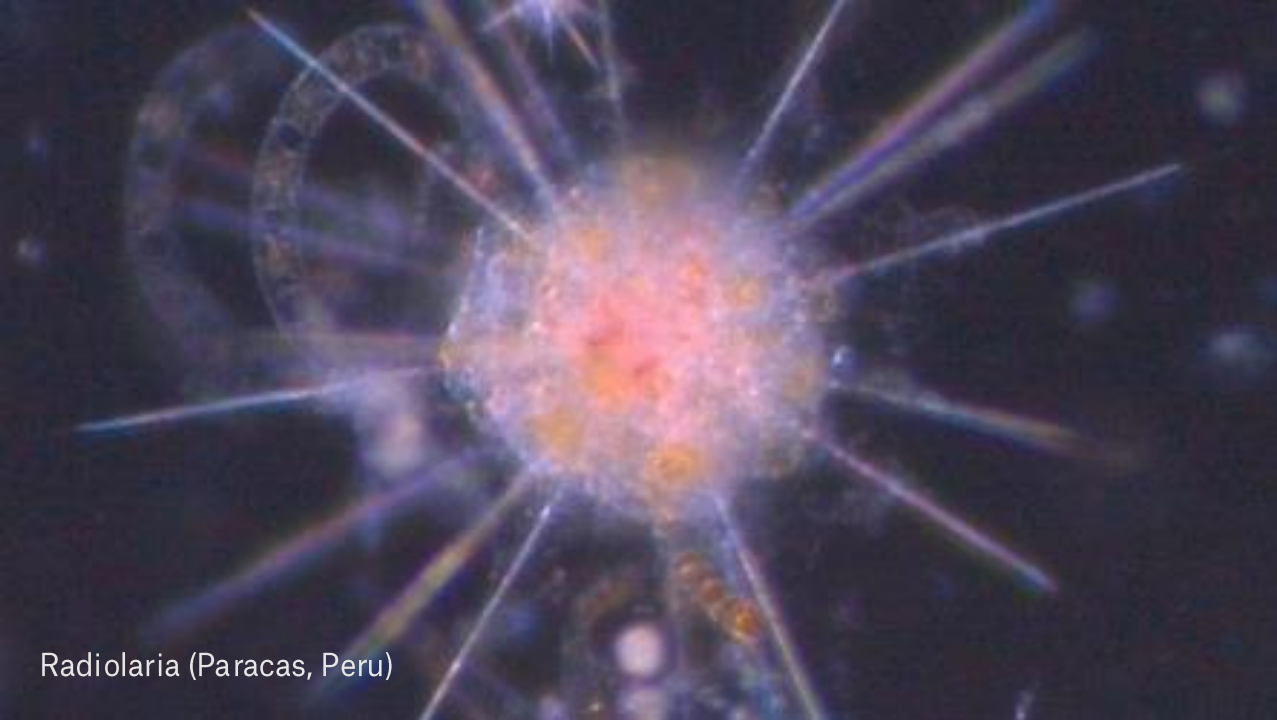

Over the course of our trip we sailed over 3000 nautical miles. In mere days we crossed into new regions, new countries, new continents, and new cultures. It would be impossible to tell the story of all of these places in one lifetime, let alone one trip. But through our excursions, our local guides, and our onboard lectures, we felt a real sense of the diversity of peoples and places that call the Pacific coast home. In many ways the ancient cultures that have resided here can still be seen and felt—not only from artifacts and geoglyphs like the Nazca lines, but in the living languages and traditions that can still be found in the daily lives of the people who live here, from the Atacama desert of Chile to the tropical rainforests of Costa Rica.

Plankton samples

What's in the water? Using a plankton net to collect water samples from our stops between Coquimbo and Costa Rica, we found out! We put the water samples under the microscopes and our marine biologists interpreted what they saw. From phytoplankton, those tiny photosynthetic organisms at the base of the food web, to larvae of more familiar animals like crabs, we encountered many different creatures. Let's look at some of what we found!

Radiolaria (Paracas, Peru)

Diatoms (Arica, Peru)

Copepod with egg sack (Cebago, Panama)

Sea urchin larvae (Curu, Costa Rica)

Citizen Science NASA Cloud Observer

Clouds aren't just shapes in the sky; they are important components of Earth's heat budget and balance. Information about when, where, and what types of clouds are forming helps scientists understand more about Earth's climate and climate change. Through NASA's GLOBE Cloud Observer program, we help contribute such data.

Our citizen scientists submitted 8 observations over 7 sessions to the global database run by NASA. Our observations were matched to data from weather satellites orbiting above and will be used to better understand global weather phenomena.

If you would like to continue cloud observations at home, you can download the app 'GLOBE Observer.'

Citizen Science

Happywhale

Cetaceans— whales, dolphins, and porpoises— capture our imaginations and our hearts whenever we witness them.

And, doing something as simple as taking a photo of them can help scientists learn more about these animals. That's where Happywhale comes in: by using AI to match images of whales submitted by users, they can track individuals as they migrate across the world and through their lives. When you submit a photo of a whale, you will be notified of any past and future matches of that individual!

We spotted this humpback whale just outside of Iquique with a unique fluke deformity. We submitted its photo to Happywhale and got a match: this whale has been seen in the same area already twice this year!

View the MS Roald Amundsen's submissions to Happywhale during our voyage:

[Happywhale – MS Roald Amundsen](#)

Citizen Science iNaturalist

During our voyage we traversed many ecosystems and biomes. From the coastal deserts of Chile and Peru to the rainforests of Costa Rica, each place presented new and unique species, some found nowhere else in the world. The impressive amount of species and observations we documented on the citizen science app iNaturalist reflects how much ground (and sea) we covered! What's more impressive: thanks to you, we broke HX's record for most observations on a single voyage! Through iNaturalist, these observations can now be used as data in global scientific research.

In total we recorded:

- **421** Species
- **1188** Observations

... and counting; as you upload more photos from home our dataset grows!

View our data submitted on our iNaturalist project here:

[2025 April 4 - 21: MS Roald Amundsen - Pacific Latin America - iNaturalist](#)

Citizen Science eBird

At sea and on land, our onboard ornithologists were constantly surveying the avifauna we encountered along our route. The diversity of habitats we traveled through provided us with an equally diverse array of birds, from majestic albatrosses at sea to resplendent jungle parrots.

Including 10 onboard Wildlife Watches and 6 eBird sessions on deck, we recorded 199 bird species across 65 eBird checklists. Through the eBird platform, the data we collected is available for scientists around the world to help understand patterns of bird distribution, migration, and habitat use.
